                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein and coding sequences of proteins from Moraxella catarrhalis. These can be used to produce vaccines which protect against M. catarrhalis infection, which can obtitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention.

Also described are: (1) an isolated plasmid comprising the above expression vector; (2) a method of transforming at host cell comprising adding the above plasmid to host cells under appropriate conditions; (3) a transformed host cells under appropriate conditions; (3) a transformed host cell comprising the steps of obtaining a host cell comprising the steps of obtaining a host cell comprising the steps of obtaining a host cell comprising the steps of obtaining a host cell comprising the the protein, and culturing the host cell under conditions for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Expression vector for producing heterologous proteins in host cells comprises a nucleic acid encoding a kinase and a DNA binding regulator which hybridizes under stringent conditions to nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     637 SIANGGSSTNTELKKAVLGLT--VTPNITPDGQIIMTV--KINKDSPAQCASGNQTILCI 692
expression of protein. The expression vector of the present invention can be used for producing heterologous proteins in host cells, particularly, lipase in Pseudomonas. Lipases produced can be used in detergents and cleaning formulations in industrial processes. These invention provides a higher production level and efficiently express a heterologous protein. The present sequence represents XCpQ isolated from Pseudomonas alcaligenes, from the present invention.
                                                                                                                                                                                                                                                  7.1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a polynucleotide encoding a DNA binding regulator that can regulate the expression of a lipase. The invention also relates to an expression system comprising components of Pseudomonas alcaligenes lipase regulation cascade which includes kinases, DNA binding regulators, polymerases, promoters, upstream activating factors and secretion factors. DNA binding regulators of the invention are useful for regulating the expression of a lipase, where the lipase is useful in detergents and other cleaning formulations as well as a number of industrial processes. Various components of lipase regulation cascade is useful in expression methods and systems designed for the production of heterologous proteins. The present sequence is P. alcaligenes XCPQ, a secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide encoding DNA binding regulator, useful for regulating expression of lipase especially in pseudomonad, and lipase useful in detergents and other cleaning formulations and in various industrial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of secretion factor KopO of Pseudomonas alcaligenes. The secretion factor is encoded by an open reading frame identified in a cosmid (see AF10070) derived from P alcaligenes DNA. Secretion factors aid the secretion of other proteins from a cell. A new expression system comprises. Components of a lipase regulation cascade including a kinase. DNA binding regulator, polymerase, a promoter, an upstream activating sequence, and secretion factors. The secretion factor is preferably camenbor of the Kop protein family (see AMB82556-68) and acts in concert with other members of the Kop family. Plasmids and transformed cells are provided, and also host cells which further comprises a nucleic acid encoding a desired protein, especially an estense, hydrolase, lipase, isomerase, matase, transferase, kinase comprises (claimed). A hyper-producing strain can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            24 AAP-----LPLVHAAEPVAVSQGAETWT-----INWKDADIRDFIDQVAQISGETFVV 71

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in their use in identifying the genes, their use in the discovery of novel antibiotics, the sessential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella compendate, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an organisms. The present sequence represents an oversity from MIPO at this patent did not form part

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The provaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella predemoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be useful contain antibodies capable of binding to the expressed proteins, and to obtain antibodies capable of binding to the expressed proteins. The protein can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an awide variety of organisms. The present sequence represents an essential prockaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
of the printed specification, but was obtained in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye plaseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and positive barthollmitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.

Bordetella pertussis possesses a type III secretion system. Type III secretion systems allow bacteria to target virulence factors directly at the state of the present sequence is the BSCC protein of B. pertussis. The present protein is encoded by a class I type gene and is involved in the type III secretion system of B. pertussis i.e. a Bordetella pathogenicity protein. The gene of the present protein is located within a pathogenicity island (see AAA6489). A pathogenicity island is a compact, distinct genetic unit carrying virulence genes. The present protein may be used to treat or diagnose B. pertussis infection, e.g. as a vaccine. Whooping cough is a disease caused by infection by B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                539

The polypeptides can be used as vaccines against chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venerallymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent citits media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae ganome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                               Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          164 YKLKYQNGEVIANALQDIGYNLYVTTAMDEDFINTLNSIQWLEVNNSIVIIGNOGNVDRV

The nucleic acids may be used for the recombinant production of the Chlamydia polypeptides (either in vivo or in vitro) according to standard recombinant DNA methodologies. The polypeptides may then be used to vaccinate against Chlamydia infections in mammals. Chlamydia, such as C. pneumoniae, are pathogens responsible for upper respiratory tract infections such as community acquired pneumonia, acute respiratory tract disease and bronchitis and may be implicated in atherosclerotic changes and asthma. The nucleic acids may also be used as probes for detecting the presence of Chlamydia nucleic acids in samples (and therefore diagnose infections) and the proteins may be used as antigens for the production of antibodise that may be used to detect Chlamydia proteins in samples (e.g. via enzyme linked immunosorbant assay (ELISA)).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             301 YKLKYQNGEVIANALQDIGYNLYVTTAMDEDFINTLNSIQMLEVNNSIVIIGNQGNVDRV 360

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y38879) can be used in municipant compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                    Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 563 DDKWGAETKINLPITAAANSISLVRAISSGALNLELSASESLS-----KTKTLANPR

Sequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as atherosclerosis, coronary artery disease, carotid artery stenosis, myocardial infarction, cerebrovascular disease, aortic aneurysm, eludication and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions for the prevention or treatment of chlamydial infections, particularly Chlamydia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      615 VLTQNRKEAKIESGYEIPFTVTSIANGGSSTNTELKKAVLGLTV--TPNIT---PDGQII 669
pneumoniae infections. The proteins may also be used in the detection of Chlamydia pneumoniae, and the nucleic acids may be used in PCR, branched DNA probe assay or blotting techniques for determining Chlamydia pneumoniae gene expression. The present sequence represents a specifically claimed Chlamydia pneumoniae protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    546 VVIMNQTPARIAVVDEM----SIAVSSDKDKAQYNRAQYGIMIKMLPVINVGEEDGKSY

The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA01041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence of the present invention. Proteins expressed from the genome sequence of the present invention. Proteins expressed from the genome sequence of the present sequence is a protein antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes. related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms.

polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to rescore normal activity of (11) or to treat disease states involving (11). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and canno acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Conductor amino acid sequences of the invention.

Conductor amino acid sequences of the invention.

Conductor amino acid sequences of the invention.

Conductor amino acid sequence acts for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO specification, int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           13;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        446
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  286
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               336
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      519
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        337 NNAPKTFTGRKISLDFQDVEIRTILQILAKESGMNIVASDSVNGKMTLSLKDVPWDQALD 396

                                                                                                                                                                                                                                                                                                                    The structure of a mover method to the antiques and antiques are altergen, a tissue or host prone to auto-immunity, where the antiques are used in a vaccine, comprises providing antibody preparation from a plasma pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prone to auto-immunity. The hyperimmune serum-reactive antigens comprising any of the 62 sequences of 53-261 amino acids fully defined in the specification, or their hyperimmune fragments are useful for the manufacture of a pharmaceutical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The preparation of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or colonisation against S. aureus or S. epidermidis. The preparation of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepailtis A, B or C), fungal or protozocan pathogens. This sequence represents a staphylococcal protein relating to the method for identifying and producing pathogen specific antigens of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SKKTAYTNAVQAAKDILNKSNGQNKTKDQVTEAMNQVNSAKNNLDGTRLLDQAKQTAKQQ 3618

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential compared to the concoded proteins. The prokaryotes used are compensed themselves and the encoded proteins. The prokaryotes used are compensed to the standard coli, Staphylococcus aucus, Salmonella typhi, Klebsiella compensed to the standard coli, Staphylococcus aucus, Salmonella typhi, Klebsiella compensed to the special for the identification of potential new targets invention is also useful for the identification of potential new targets of an antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery comportance. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen contain prokaryotic called which are required for cell proliferation in essential prokaryotic callular proliferation protein.

Compensed the printed specification, but was obtained in electronic for the printed appecification, but was obtained in electronic for the mind in the contains and the coll processed the contains and the coll produced the contains and the coll processed the contains and the coll processed the coll processed the contains and the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll processed the coll pro

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential comparable is and the discovery of novel antibiotics, the essential comparable is another encoded proteins. The prokaryotes used are carberichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella convention is also useful for the antisense nucleic acids can also be used to invention is also useful for the antisense nucleic acids can also be used to invention antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery can to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery corparames. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organism. The present sequence represents an essential prokaryotic cellular proliferation protein.

Confirm directly from WIPO at this patent did not form part cofferent directly from WIPO at the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   30;

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in their use in identifying the comparation of their use in identifying the genes, their use in their use in identification, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facefals. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds uncleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an esential prokaryotic cellular proliferation protein.

The invention relates to a method for identifying antigenic polypeptides expressed by pathogenic organisms e.g., Staphylococcus aureus during infection, by SEREX (serological identification of antigene by recombinant expression cloning) techniques. The method involves providing a nucleic acid library encoding genes/partial gene by recombinant expression cloning) techniques. The method involves control of pathogenic organisms, transforming/transfecting library into host cells, contacting the polypeptides expressed by the genes with autologous antisera derived from an animal infected with, or has been infected with the pathogen and purifying the nucleic acid encoding the polypeptide or partial polypeptide binding to the antisera. Also included are the nucleic acids and polypeptides for the control of monocional antibodies against the polypeptide and the production of monocional antibodies against the polypeptide and the production of monocional entibodies and antibodies are useful for manufacturing a medicament for treating Staphylococcus aureus-associated septicaemia, the prodermidis-associated septicemia, peritonitis, endocarditis, tuberculosis, blood infections, sepsis, meningitis, pneumonia, stomach ulcers, gonorkea, necrotising fascitis, impetigo, lyme's disease, is an S. aureus protein sequence is an S. aureus protein sequence is an S. aureus protein sequence is an S. aureus protein sequence is a sociated septicemia, it is in he company of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              40;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TAK----TEAQQVINNERATPQQVSDALTKVRAAQTKIDQAKALLQNKEDNSQLVTSKNN 1003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2852 STKQNAYTIKVTNAEHIISGTPTVVTTPSEVTAAANQVNSAKQELNGDERLRVAKQNANT 2911
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          466
      invention is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     194
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  227

The invention relates to isolated polymucleotide (I) and polymeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags of or selective production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags to restore normal activity of (II) or to treat disease states involving constituting a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical insolvents involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.

                                             δ
                                                                                                   ò
                                                                                                                                                                                                                                                                                 The invention relates to isolated polymucleotide (I) and polymerase chain reaction (FOR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving correction or (II) is useful for generating antibodies against it, detecting or (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical clasorders involving aberrant procein expression or biological activity. The polypeptide and polymucleotide sequences have applications in capanostics, forensics, gene mapping, identification of mutations of diagnostics, for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and condication in oaid sequences. ABG00010-ABG30377 represent novel human of diagnostic amino acid sequences of the invention.

Condigination, but was obtained in electronic format directly from WIPO

The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T? promoter) operably linked to a modified hmwABC operon from a non-typeable (non-encapsulated) H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mature HMW protein; hmw gene; hmwAl; hmwA2; high molecular weight; non-typeable Haemophilus influenzae; NTHi; non-encapsulated; recombinant production; Escherichia coli; antibacterial; vaccine; human disease; otitis media; epiglottitis; pneumonia; tracheobronchitis;

influenzae (NTHi). Most HMW-expressing NTHi strains contain two hmw gene clusters termed hmw1ABC and hmw2ABC. Each hmwABC operon comprises hmwA, hmwB and hmwC genes encode accessory proteins which are and the hmwB and hmwC genes encode accessory proteins which are responsible for post-translational processing and secretion of the HMWA responsible for post-translational processing and secretion of the HMWA proteins. The modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the mature HMWA. The invention also discloses hmwA genes (AAA52175-A52198) and HMWA proteins (AAB01824-B01849) from the non-typeable H influenzae crarains Joyc, KI, K21, LCDC2, PMH, 15 and 12. The non-typeable H influenzae encoding which can be used as vaccines to mediate a humoral or proteins which can be used as vaccines to encodiate a humoral or humans caused by H. influenzae (e.g., ottis media, epiglottiis, pneumonia and tracheobronchtis). The HMW proteins and/or HMW peptides. The mulbodies against themophilus, HMW proteins and/or HMW peptides. The nucleocide sequences encoding the HMW proteins and/or HMW peptides. The mulbodies against Hemophilus, HMW proteins and/or HMW peptides. The mulbodies against themophilus, HMW proteins and tracheobronchilus and clone hmw genes from other present sequence represents a mature HMWA protein from a non-typeable grains of H. influenzae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               412
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        583

The invention relates to the recomminant production of naturally incluence high molecular weight (HWW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T7 promoter) operably linked to a modified hmwABC operon from a non-typeable (non-encapsulated) H. C. clusters termed hmwABC and hmwABC and hmwABC operon comprises hmwA, hww and hmwC genes encode the structural HWWA proteins and the hmwB and hmwC genes encode accessory proteins which are cresponsible for poet-translational processing and secretion of the HWWA proteins. The modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the creaming the modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the and HWMA proteins (AABO1824-B01849) from the non-typeable H influencae and HWMA proteins deed for the production of recombinant H influencae HWW creams are used for the production of recombinant H influencae HWW proteins which can be used as vaccines to mediate a humoral or cell-mediated immune response to provide protection against diseases in the munomas caused by H. influencae (e.g., othlis media, epigloctiis, on the proteins and tracheobromchitis). The HWM proteins are also useful as antigens in immunoassays for detecting antibodies against Haemophilus, they broteins can be used to isolate and clone hum genes from other constructs and presents an HWMA proteins an on-typeable strains of Haemophilus via hybridisation reactions. The

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the greas, their use in the discovery of novel antiblotics, the sessential comparation is their use in the discovery of novel antiblotics, the sessential comparation is also used are scherichia coli, Staphylococcus auceus, Salmonella typhi, Klebsiella coli seducomonas aeruginosa and Enterococcus facedis. The commoniae, Pseudomonas aeruginosa and Enterococcus facedis. The commoniae, Pseudomonas aeruginosa and Enterococcus facedis. The commonia antibodies capable of binding to the express these proteins, to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen correct the proteins nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Col the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coll, Staphylococcus aureus, Salmonalla typhi, Klebsiella pneumoniae, Pseudomonas and Enterococcus faecalis. The invention is also useful for the identification of potential new targets

for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. And to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen confloques mucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Itp.wipo.int/pub/published_pct_sequences.

New polynucleotides for the identification and development of antibiotics, comprise sequences of antisense nucleic acids -	qa	
of the state of th	∂	584 SLVRAISSGAL
Example of degree to no recool orther registration	qq	581 STTKNALNGNE
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the	δ	622
genes, their use in the discovery of novel antibrotics, the essential genes themselves and the encoded proteins. The prokaryotes used are	qa	641 LNTAMGNLKQA
Escherichia coli, staphylococcus aureus, salmonella lypni, Alebbiella pheumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The	ò	650 KKAVLGLTVTF
invention is also useful for the identification or potential new targets for antibiotic development. The antisense nucleic acids can also be used	qa	700 EQAIKQVNAAK
to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.	à	704 ENGGILIVGGI
The proteins can be used to screen compounds in rational and alsovery programmes. The antisense nucleic acid sequence is also useful to screen	qq	:
a wide variety of organisms. The presents sequence represents an	ò	748 RRELLIFITPR
essential proxaryonic cellular proliteration process. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic	ব্	807 KAEALISATPL
<pre>format directly from WIPO at ftp.wlpo.int/pub/published_pct_sequences.</pre>	RESULT 39	39

                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the sesential compared to the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococus auteus, Salmonella typhi, Klebslella carbention is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to invention antibodies capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery conto obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at the printed proteins.

The sequence date for this patent did not form part of the wipo.int/pub/published_pct_sequences.

                                                                                                                                                                          The invention provides proteins (AAY27201-245) from Neisseria meningitidis (strains A and B) and nucleic acid sequences (AAX99123-167) encoding the proteins. Compositions comprising the protein, nucleic acid or antibody specific to the protein are useful as pharmaceuticals, e.g. a vaccine composition or a diagnostic composition. The composition is also useful for treating or preventing an infection due to Neisserial bacteria, especially Neisseria meningitidis.

US-09-815-242-13083

US-09-815-242-13083

Sequence 13083, Application US/09815242

Patent No. US202002061569A1

APPLICANT: Haselbeck, Robert

APPLICANT: Colsen, Kari L.

APPLICANT: Zyskind, Judith W.

APPLICANT: APPLICANT: Grant J.

APPLICANT: APPLICANT: Grant J.

APPLICANT: Xu, H. Howard

ITTLE OF INVENTION: Robert T.

APPLICANT: Yamamoto, Robert T.

APPLICANT: Yamamoto, Robert T.

APPLICANT: Wanner, W. Howard

ITTLE OF INVENTION: Identification of Essential Genes in TITLE OF INVENTION: Prokaryotes

FILE REFREENCE: ELITRA AD1A

CURRENT APPLICATION NUMBER: US/09/815,242

CURRENT FILING DATE: 2001-03-21

PRIOR APPLICATION NUMBER: 60/206,848
